

# IBM PS/2 Model 50Z

The IBM PS/2 Model 50Z is a desktop personal computer that was produced by IBM in the late 80s. It was part of the IBM PS/2 series, which was IBM's successor to the original IBM PC. The Model 50Z was a low-end model of the PS/2 series and was targeted at the home and small business market. It featured an Intel 80286 microprocessor running at 12 MHz on a Microchannel bus, 1MB of RAM and a 20MB hard drive. It also had a built-in 3.5-inch floppy drive and supported VGA graphics. Its base price was \$3595.

The Model 50Z was compatible with IBM's PS/2 line of peripherals and ran on IBM's proprietary operating system, OS/2. The IBM PS/2 Model 50Z was a popular choice for home and small business users because of its performance, expandability, and compatibility with a wide range of software.
