

IBM Wheelwriter

The IBM Personal Wheelwriter is a series of electric typewriters produced by IBM in the 1980s and 90s. It was designed for personal and small office use and was intended to be a more reliable and user-friendly alternative to traditional manual typewriters. The Wheelwriter featured a "write-ahead" buffer that allowed the typist to type faster than the machine could print, resulting in fewer errors and a smoother typing experience. The Wheelwriter also had a built-in correction system that allowed the typist to easily correct mistakes. The machine had a variety of font options, including proportional spacing, and some models came with a built-in dictionary and word processing capabilities. The IBM Personal Wheelwriter was a popular choice for personal and small office use, and it was known for its reliability and ease of use.
